PREFACE

The Reports of the Nagycenk Geophysical Observatory have been started in 1957 with earth current data. Later, from 1961 on, geomagnetic, from 1962 on, atmospheric electricity and from 1967 on, ionospheric data have been included, too. The present report for the years 1988-1989 has been compressed with respect to the earlier ones. Data series which proved to be of great value for any type of study have been preserved, others were dropped or reduced. In order to minimize delay in publication, the present volume contains data for two consecutive years.

This report has been completed with a list of yearly averages of the geomagnetic elements from the beginning of our observations.

As the railway line Sopron-Győr near the Observatory has been electrified in the year 1987, the recording of Pc1 pulsations had to be stopped since then due to severe noise in this frequency range. The noise level in other frequency range did not disturb strongly the other types of recordings, thus the series of reports will be continued.

The compilation of atmospheric electric and ionospheric data remained unchanged.

Exchange copies of these Reports can be obtained from the Geodetic and Geophysical Research Institute of the Hungarian Academy of Sciences (H-9401 Sopron, Pf. 5, Hungary).

Sopron, June 1993

P. Varga
Director

A. ELECTROMAGNETIC FIELD OF THE EARTH

The coordinates of the Geophysical Observatory Nagycenk are the following:

$$\begin{aligned} \varphi &= 47^{\circ}38' & \lambda &= 16^{\circ}43' \\ \phi &= 47.2^{\circ} & \Lambda &= 98.3^{\circ} \\ L &= 1.9 \end{aligned}$$

Times are given in CET (i.e. UT + 1 h), nearly corresponding to LT (- 7 min)

Tables published in this part are the following:

1. 3-hour geoelectromagnetic activity indices T-M, corresponding to the greatest of five indices:

The electric activity indices T for the E_x and E_y component, having a linear scale with a step of 1.8 mV/km. The range of values is 0 to 9.

The magnetic activity indices M for the components D, H and Z have also a linear scale with a step of 7 nT in the same range. The electric and magnetic scales are determined so, that the averages are the same in a basic interval.

2. The indices K_1 and K_5 refer to complete days and express the activities in the period ranges 0-2 min (pulsations) and 24-60 min (substorms). The scales of K_1 and K_5 are as follows:

Period range	Limits between K/values								
	0-1	1-2	2-3	3-4	4-5	5-6	6-7	7-8	8-9
K_1	2	4	7	13	18	23	29	41	54
K_5	29	43	67	88	110	131	191	234	339

These values are given in units of 10^{-5} V/km.

Values in brackets mean extrapolated ones from incomplete data,

where the lacking intervals were substituted by the average of recorded intervals.

The list of disturbed (D) and quite (Q) days selected by the following rule: A day is taken as disturbed on the basis of all magnetic and earth current activity indices, if the greatest of the simultaneous character figures decreases only in one of the three hour intervals to 3, in the other intervals they are greater. A day is taken as quiet, if the greatest of all activity indices has not reached 3. Five activity indices (two of the earth currents and three of the magnetism) are always taken into account.

3. Daily variation of the three geomagnetic elements as monthly average. Values are differences in nT between the actual hourly average and the corresponding monthly mean. The monthly averages are given in absolute values (in the case of D the monthly mean is given in minute of arc).

4. Yearly means of the geomagnetic elements 1961 to 1987 in nT and minutes of arc. These values are the results of a reevaluation of previously published data, including corrections eliminating disturbances caused by construction works in the observatory. Corrected values are noted by asterisk.

5. List of special events, common table from magnetic and earth current records. Tables are given for SSC/s, SI/s and bays (substorms) and Pi2 pulsations.

6. Pulsation indices. The indices have been determined from occurrence frequency of different period pulsations, striving at a possibly uniform distribution of days in each of the five possible indices (1-5) in a basic interval.

The determination of these indices can be shortly explained as follows. The days are arranged according to the occurrence frequency of each band. Index 1 is attributed to the days with

the lowest fifth of occurrence frequencies (0 to 20 per cent) index 2 to days with occurrence frequencies in the second lowest fifth (20 to 40 per cent) etc.. index 5 to days with highest occurrence frequencies (80 to 100 per cent). It must be reminded that mainly in the lowest and highest period bands the uniform distribution could not be achieved due to insufficient occurrence of these bands of the records.

The bands are the following:

P1	0	to	5 sec
P2	5	to	15 sec
P3	10	to	15 sec
P4	15	to	20 sec
P5	20	to	25 sec
P6	25	to	30 sec
P7	30	to	40 sec
P8	40	to	60 sec
P9	60	to	90 sec
P10	90	to	120 sec
P11	2	to	5 min
P12	5	to	10 min

For a detailed description of the method of determination of these indices, see:

L. HOLLÓ, M TÁTRALLYAY and J. VERÓ Experimental results with the characterization of geomagnetic micropulsations (Acta Geod., Geoph. Mont. Hung 7/1972/15).

A detailed description of the processing and compilation is found in the Report of the Observatory for 1966 in German and in ÁDÁM, A., VERÓ, J., Cz. MILETITS, J., HOLLÓ, L. and WALLNER, Á: The geophysical observatory near Nagycenk. I. Electromagnetic measurements and processing of data (Acta Geod. Geoph. Mont. Hung., 16/1981/333).

B. ATMOSPHERIC ELECTRICITY

Atmospheric electricity data have been published since 1962. Table I contains the hourly average values of the potential gradient expressed in V/m. Hourly averages have been taken only from hours having a recording period of 30 minutes or more. If values were available only for part of an hour the average is entered in square brackets []. These data have been used in the determination of the monthly and daily means. Values uncertain for some reason are entered in round brackets () and have not been used in calculating monthly and daily means. Daily means of each day with 24 hours of recording are entered. However, loss of a maximum of one hour's data out of twelve (for example, on account of instrument maintenance or calibration) has not precluded entering this mean value. In hours marked by S the value of the potential gradient exceeded permanently or several times the measuring limits of the equipment making the determination of an hourly average impossible. The direction of the deviations are marked by signs. For June, 1989 data are missing on account of instrument trouble,

Table II gives the hourly means of quantities of positive and negative charges transported by point-discharge for each month. The values are expressed in 10^{-6} Asec/hour.

All data are presented in universal time (GMT).

Both the equipments and methods of measurements of potential gradient and point discharge have been described in the paper by P. BENCZE and F. MÁRCZ: "Atmosphärisch-elektrische und ionosphärische Messungen im Observatorium bei Nagycenk". Observatoriumsberichte des Geophysikalischen Forschungslaboratoriums der Ungarischen Akademie der Wissenschaften vom Jahre 1966, Sopron, 1967. Further information is given by P. BENCZE and F. MÁRCZ: "The Geophysical Observatory near Nagycenk. II. Atmospheric electric and ionospheric measurements" Acta Geod. Geoph. Mont. Hung. 16/1981, 353-357.

I. Hourly means of the

C. IONOSPHERE

The following tables give the values of mean ionospheric absorption at oblique incidence (A3) for certain zenith distances of the Sun (κ) expressed in decibels (dB). Values for ground sunset (SS) and ground sunrise (SR) are given for periods of 20 minutes centered on the times of $\kappa = 90^\circ$. Night values have been determined by taking the periods ranging from $\kappa = 100^\circ$ to 23 00 GMT.

The sky wave of the transmitter Československo (f =272 kHz) has been recorded since January 1967. The geographical coordinates of the reflection point are 48.4° N, 17.1° E. Because of reconstruction works on the transmitter Československo, the absorption measurement at 272 kHz and the publication of data were suspended from April 1975 till September 1978.

The equipment and the method have been described in the papers by P. BENCZE and F. MÁRCZ: "Atmosphärisch-elektrische und ionosphärische Messungen im Observatorium bei Nagycenk". Observatoriumsberichte des Geophysikalischen Forschungslaboratoriums der Ungarischen Akademie der Wissenschaften vom Jahre 1966, Sopron, 1967, as well as by P. BENCZE, J. HORVÁTH and F. MÁRCZ: "A new equipment for the measurement of ionospheric absorption" Geophysical Observatory Report of the Geodetic and Geophysical Research Institute of the Hungarian Academy of Sciences, Year 1975. Observatory of Nagycenk, Sopron, 1976. Further information is given by P. BENCZE and F. MÁRCZ: "The Geophysical Observatory near Nagycenk II. Atmospheric electric and ionospheric measurements". Acta Geod. Geoph. Mont. Hung. 16(1981), 353-357.

Mean Ionospheric Absorption L'(dB) at Oblique Incidence (A3)

f=272 kHz

for 1988
