Foreword

In 2021, the Kövesligethy Radó Seismological Observatory continued to operate the 15 permanent and 26 temporary broadband stations installed in the previous years. Additionally, 5 temporary stations were in operation for monitoring the local seismicity in two regions. During the year, one new station was installed as the part of the Integrated Geodynamic Station at Badacsonytördemic.

During the year, 1616 local events have been detected by the Network in the area confined by the latitudes 45.5-49.0°N and longitudes 16.0-23.0°E and 10 earthquakes were felt by the public in Hungary.

Chapter 1 of this publication presents the Hungarian National Seismological Network and the data processing procedure performed in the Kövesligethy Radó Seismological Observatory. The focal parameters of the detected local events are listed in Chapter 2. In Chapter 3, the macroseismic data of the felt earthquakes are shown. Chapter 4 reports the phase readings of the local events in ISF2 format.

1. The Hungarian National Seismological Network

Seismological stations and data collection

At the end of the year 2021, the Hungarian National Seismological Network (HNSN) operated by the Kövesligethy Radó Seismological Observatory (KRSO), Institute of Earth Physics and Space Science (EPSS) consisted of 15 permanent broadband stations and 26 broadband temporary stations. The 26 temporary stations were operated in the frame of the international AlpArray and PACASE (Pannonian-Carpathian-Alpine Seismic Experiment) projects, 15 of which are equipped and co-operated by the German Seismological Broadband Array (DSEBRA).

During the year, additionally 5 seismological stations were operated in two seismically active region in Hungary: 3 short period instruments in the Mór Graben and two broadband instruments in Heves county. One new station was installed at Badacsonytördemic as part of the Integrated Geodynamic Station.

Tables 1.1, 1.2 and 1.3 contain the parameters of the permanent and temporary HNSN stations, respectively. Their location is shown in Fig. 1.1.

The data coming from these stations have been collected, stored and processed in the Observatory using the SeisComP3 software package (<http://www.seiscomp3.org>). Besides the HNSN stations, the Observatory collects and processes the data of several stations of the following seismological networks:

- Austrian Seismological Network (OE) – <http://www.zamg.ac.at>
stations: ARSA, CONA, OBKA
- Croatian Seismological Network (CR) – <http://www.gfz.hr/eng/seizmologija/>
stations: PTJ, ZAG
- Czech Seismological Network (CZ) – <https://www.ig.cas.cz/en/seismic-service>
stations: CKRC, JAVC, KRUC, MORC, PRU, TREC, VRAC
- GEOFON (GE) – <http://geofon.gfz-potsdam.de>
stations: STU, TIRR, VSU
- MEDNET (MN) – <http://mednet.rm.ingv.it>
stations: AQU, BLY, DIVS, TIR, TRI, VTS
- Polish Seismological Network (PL) – <http://www.igf.edu.pl/plsn-en.php>
stations: KWP, NIE, OJC
- Romanian Seismological Network (RO) – <http://www.infp.ro/>
stations: ARCR, BANR, BISRR, BMR, BURAR, BZS, CJR, CRAR, DEV, DRGR, GZR, IAS, LOT, MLR, SIRR, VRI
- Serbian Seismological Network (SJ) – <http://www.seismo.gov.rs/>
stations: BBLs, BEO, DJES, FRGS
- Slovak Seismological Network (SK) – <http://www.seismology.sk/>
stations: CRVS, IZAB, KECS, KOLS, LANS, MASL, MODS, PODL, SMOL, SRO, STHS, VYHS, ZST
- Slovenian Seismological Network (SL) – <http://www.arso.gov.si/en/Seismology/>
stations: CRES, KOGS
- Carpathian Seismological Network of Ukraine (UA) – <http://seism.lviv.ua/>
stations: BRIU, CHRU, HOLU, HORU, KORU, KSV, MEZ, MORS, MUKU, NDNU, NSLU, RAKU, SHIU, STNU, STZU, TRSU, UZH

Data processing

The iLoc location algorithm

The iLoc location algorithm is based on the state-of-the-art location algorithm developed for the International Seismological Centre (ISC). The ISC locator (Bondár and Storchak, 2011) is operational since 2011, that is, the ISC Bulletin is produced with the new locator since January 2009. The relocation of the entire ISC Bulletin with the ISC locator is expected to be finished by the end of 2018. The ISC locator:

- Uses most ak135 (Kennett et al., 1995) phases (including depth phases) in the location with elevation, ellipticity (Dziewonski and Gilbert 1976; Kennett and Gudmundsson 1996) and depth-phase bounce point corrections (Engdahl et al., 1998).
- Accounts for correlated travel-time prediction errors
 - Obtains initial guess from Neighbourhood Algorithm search (Sambridge 1999; Sambridge and Kennett, 2001).
 - Performs iterative linearised inversion using an a priori estimate of data covariance matrix (Bondár and McLaughlin, 2009).
- Attempts free-depth solution only if there is depth resolution
 - Default depth for fixed-depth solutions is derived from historical seismicity.
 - Independent depth estimate is obtained from depth-phase stacking (Murphy and Barker, 2006).
- Provides robust magnitude estimates with uncertainties.

In addition to the features of the ISC locator, iLoc provides further functionality to support the needs of national seismological networks:

- Supports the use of local one-dimensional velocity models for travel-time calculations.
- Obtains travel-time predictions for crustal and mantle phases from a three-dimensional global upper mantle model compliant with the RSTT parameterization (Myers et al., 2010).
- Calculates local magnitude, ML, as well as broadband body wave magnitude, mB.
- Communicates with the SeisComp3 database schema through a MySQL client.

Location procedure

To produce the annual Hungarian National Seismological Bulletin (HNSB) all reviewed SeisComp3 events were relocated with iLoc. The SeisComp3 hypocentres include both earthquakes and anthropogenic (quarry blasts, mine explosions) events. The event type flag is set accordingly for all events in the bulletin. Bogus events were deleted from the SeisComp3 catalog.

Note that the coordinate rectangle in which we produce the HNSB includes the Pannonian basin, parts of the Alps, Carpathians and the Dinarides, so a simple 1D velocity model would not be sufficient to produce reliable travel time predictions for the large variety of geologic and tectonic provinces in the region. Relocation studies of ground truth events demonstrated that the RSTT global 3D upper mantle velocity model (Myers et al., 2010) performs better in the region than local velocity models. Hence, during the relocations with iLoc we used the RSTT model to obtain travel-time predictions for local (Pg, Pb, Sg, Sb and Lg) and regional (Pn, Sn) phases up to 15-degree epicentral distances. Beyond that we used ak135 (Kennett et al., 1995) travel time predictions.

iLoc, as all linearized location algorithms, minimizes the root-mean-square travel-time residuals of the observed seismic phase arrivals. The a priori measurement error estimate is provided for each phase that could contribute to the location of an event. During the location process, if the magnitude of the time residual of a phase (the difference between the observed and predicted arrival times) is larger than six times of the a priori measurement error, the phase is made non-defining, and it is no longer considered in the location process.

2. Local events

In 2021, 1616 local events (Table 2.1) have been detected by the Hungarian National Seismological Network in the area confined by the latitudes 45.5-49.0°N and longitudes 16.0-23.0°E. From these events 344 earthquakes (Fig. 2.1) and 1272 quarry explosions (Fig. 2.2) have been identified. Two hundred and seventy-three explosions were labeled as ground truth events based on the reports of the respective mines (Fig. 2.3).

In Table 2.1, the column *Locality* shows the name of the nearest settlement (or the name of the mine in the case of ground truth events) if the event occurred in Hungary, otherwise the name of the country is displayed.

Table 2.1: Parameters of events detected by the Hungarian National Seismological Network (Magnitude: local magnitude (ML), Type: EQ – earthquake, GT – ground truth event, EX – explosion).

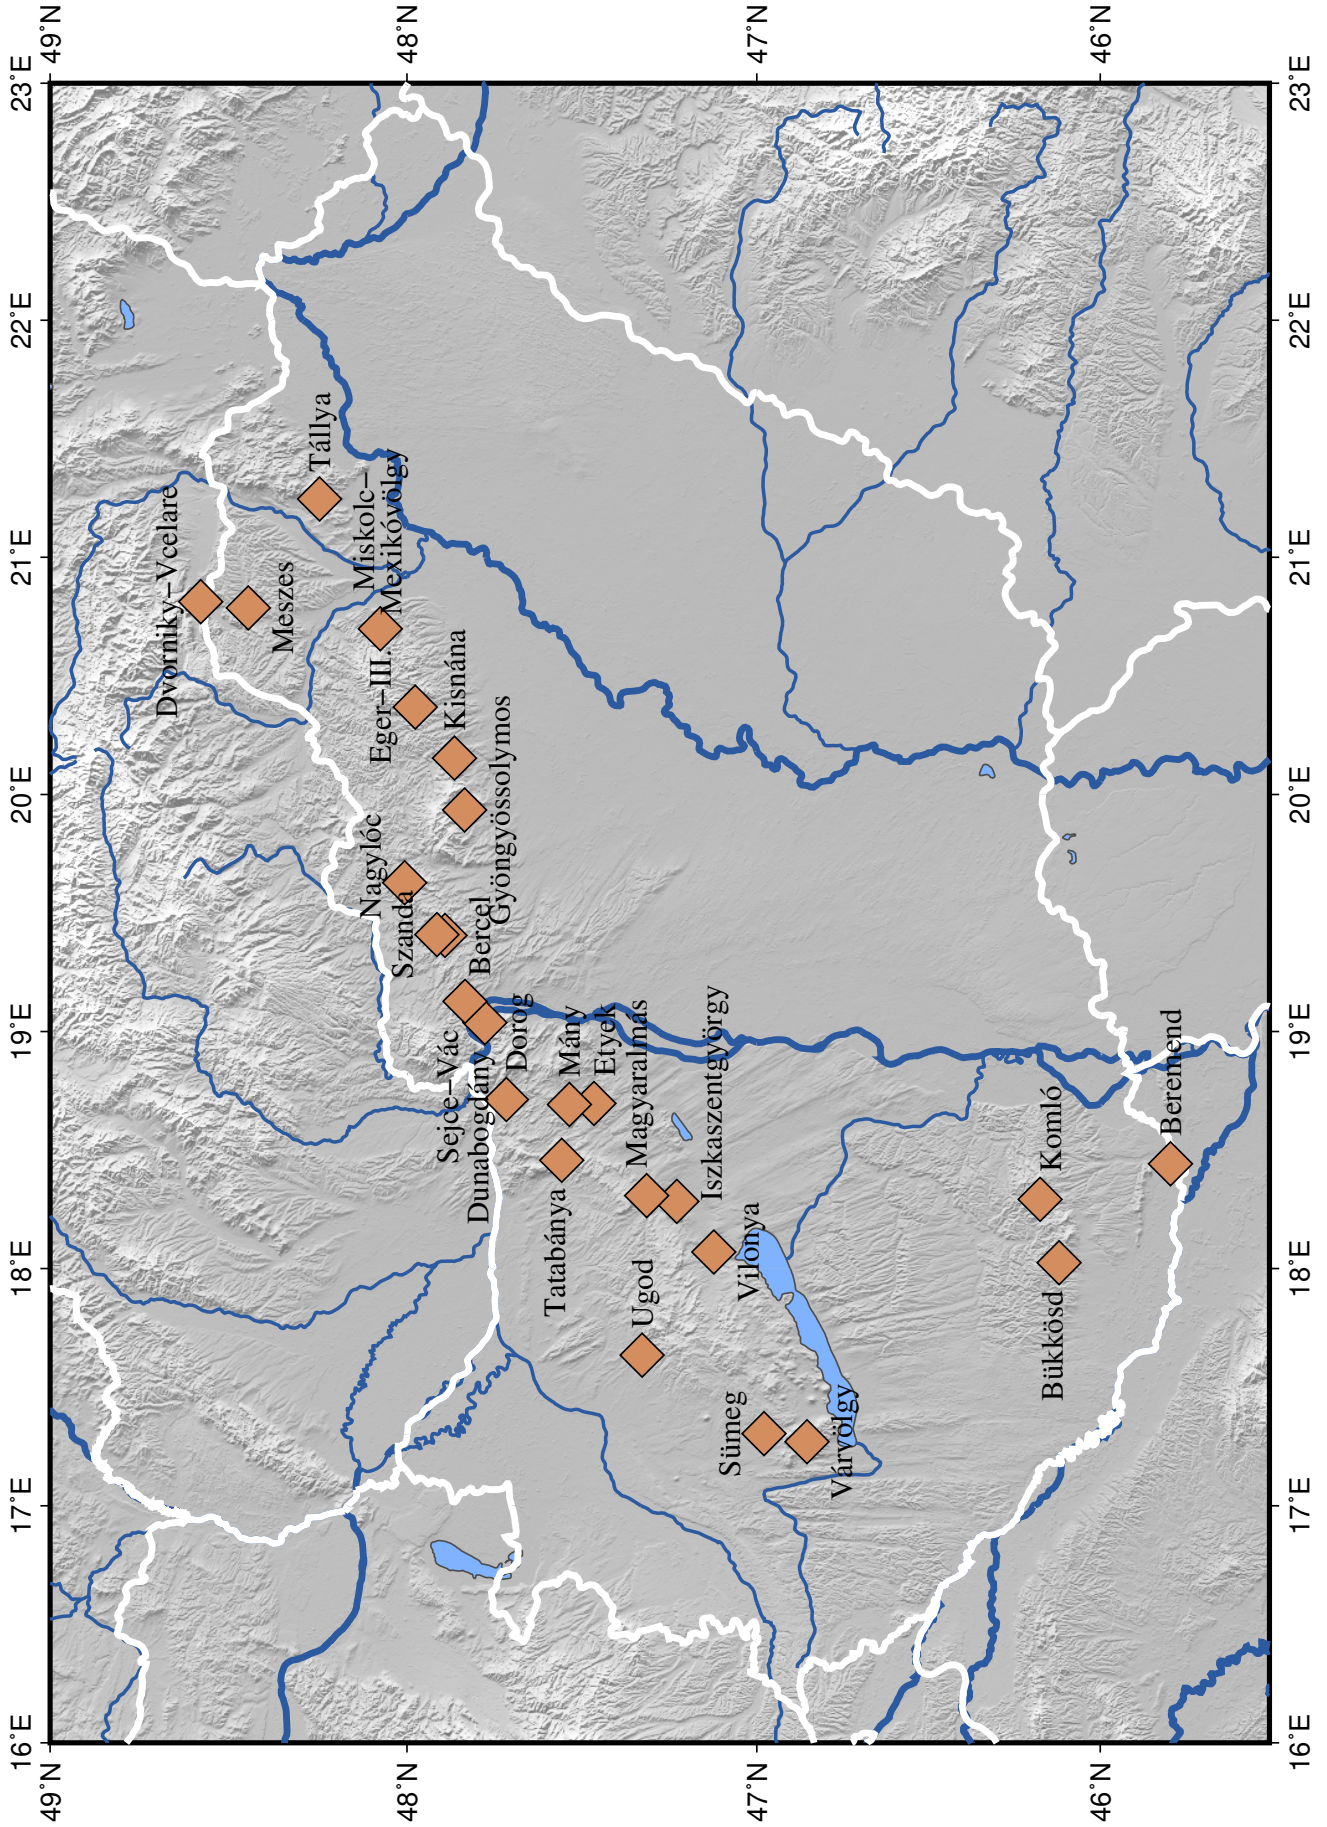

Figure 2.3: The location of the quarries with identified explosions (ground truth events).

3. Macroseismic data

During the year 2021, 10 earthquakes have been felt by the public in the territory of Hungary (Table 3.1). Two of them occurred in Croatia, outside of the area of this bulletin (latitudes 45.5-49.0°N and longitudes 16.0-23.0°E), hence their hypocentral and phase data are not shown in Chapter 2 and Chapter 4. The hypocentral parameters of these events and the maximum intensity (reported from the territory of Hungary) are shown in Table 3.1.

Macroseismic questionnaires were collected via the online form on the website of the KRSO. In this Chapter the results of European Macroseismic Scale (Grünthal, 1998) based intensity estimations are presented.

In Tables 3.2-3.11 the name of settlements, their coordinates, the estimated EMS intensity values and the number of reports (N) can be seen. Figures 3.1-3.10 show the spatial distribution of the intensity values.

| Date | Time | Lat. (°N) | Lon. (°N) | Depth (km) | Magn. (ML) | Max. intensity (EMS) |

4. Phase data

The phase data of the events occurred in the area confined by the latitudes 45.5-49.0°N and longitudes 16.0-23.0°E are presented in ISF2 format. Here we give the short summary of the blocks and fields appearing in the bulletin.

The IASPEI Seismic Bulletin Format (ISF) is the IASPEI approved standard format for the exchange of parametric seismological data (hypocentres, magnitudes, phase arrivals, moment tensors, etc.). It was adopted as standard in August 2001 by IASPEI's Commission on Seismic Observation and Interpretation at the Scientific Assembly in Hanoi, Vietnam. The format is an extension of the IMS1.0 format developed by the Center of Monitoring Research, Arlington, VA, USA in the 1990s to establish a data exchange protocol for the Comprehensive Test-Ban-Treaty Organization. The full documentation can be downloaded for both the ISF and IMS1.0 formats.

The need to add a number of data types to ISF1 has led to the development of ISF2. The format is an extension of ISF1 as all additional data are in extensions to the existing ISF1 format. The changes chiefly are improved data attribution through extended station details and channel information for phases and amplitude. Since 2013 the USGS NEIC bulletin is produced in ISF2 and the International Seismological Centre will adapt the ISF2 format in the near future. The full documentation can be downloaded for the ISF2 format at the ISC website.

The HNSB is comprised of various ISF2-compliant blocks, such as Event, Origin, Magnitude and Phase blocks, as well as optional Comment blocks inside the Origin and Phase blocks. Each block is separated by an empty line; comment lines are enclosed in parentheses.

Event block

| Position | Format | Description |
|----------|--------|-------------------|
| 1-5 | a5 | Event |
| 7-22 | a16 | Event identifier |
| 24-88 | a65 | Geographic region |

Origin block

| Position | Format | Description |
|----------|------------|--|
| 1-10 | i4/i2/i2 | date [yyyy/mm/dd] |
| 12-22 | i2:i2:f5.2 | time [hh:mm:ss.ss] |
| 23 | a1 | f=fixed origin time, blank=free origin time solution |
| 25-29 | f5.2 | origin time error (blank if fixed origin time) [seconds] |
| 31-35 | f5.2 | root mean square of time residuals [seconds] |
| 37-44 | f8.4 | latitude (negative for South) [degrees] |

| | | |
|---------|------|--|
| 46-54 | f9.4 | longitude (negative for West) [degrees] |
| 55 | a1 | f=fixed epicenter, blank=free epicenter solution |
| 56-60 | f5.1 | semi-major axis of 90% error ellipse [km] |
| 62-66 | f5.1 | semi-minor axis of 90% error ellipse [km] |
| 68-70 | i3 | strike (azimuth of semi-major axis) [degrees] |
| 72-76 | f5.1 | depth [km] |
| 77 | a1 | f=fixed depth, blank=free depth solution |
| 79-82 | f4.1 | depth error 90% confidence (blank if fixed depth) [km] |
| 84-87 | i4 | number of defining phases |
| 89-92 | i4 | number of defining stations |
| 94-96 | i3 | azimuthal gap [degrees] |
| 98-103 | f6.2 | distance to closest station [degrees] |
| 105-110 | f6.2 | distance to furthest station [degrees] |
| 112 | a1 | analysis type: (a=automatic, m=manual, blank=unknown) |
| 114 | a1 | location method: (i=inversion, p=pattern recognition, g=ground truth, o=other, blank=unknown) |
| 116-117 | a2 | event type (uk=unknown) character 1: k=known, s=suspected, f=felt, d=damaging character 2: c=meteor, e=earthquake, h=chemical explosion, i=induced event, l=landslide, m=mine explosion, n=nuclear explosion, r=rock burst, x=experimental explosion |
| 119-127 | a9 | author |
| 129-139 | a11 | origin identifier |
| 141-145 | a5 | reporter |
| 147-151 | f5.1 | depth-phase depth [km] |
| 153-157 | f5.1 | depth-phase depth error [km] |
| 159-161 | i3 | secondary azimuthal gap [degrees] |

Magnitude block

| Position | Format | Description |
|----------|--------|-----------------------------|
| 1-5 | a5 | magnitude type |
| 7-10 | f4.1 | magnitude value |
| 12-14 | f3.1 | magnitude error |
| 16-19 | i4 | number of defining stations |
| 21-29 | a9 | author |
| 31-41 | a11 | origin identifier |

Phase block

| Position | Format | Description |
|----------|------------|--|
| 1-5 | a5 | station code |
| 7-12 | f6.2 | station-to-event distance [degrees] |
| 14-18 | f5.1 | event-to-station azimuth [degrees] |
| 20-27 | a8 | phase code |
| 29-40 | i2:i2:f6.3 | arrival time [hh:mm:ss.sss] |
| 42-46 | f5.1 | arrival time residual [seconds] |
| 48-52 | f5.1 | observed azimuth [degrees] |
| 54-58 | f5.1 | azimuth residual [degrees] |
| 60-65 | f5.1 | observed slowness [seconds/degree] |
| 67-72 | f5.1 | slowness residual [seconds/degree] |
| 74 | a1 | time defining flag (T or -) |
| 75 | a1 | azimuth defining flag (A or -) |
| 76 | a1 | slowness defining flag (S or -) |
| 78-82 | f5.1 | signal-to-noise ratio |
| 84-92 | f9.1 | amplitude [nanometers] |
| 94-98 | f5.2 | period [seconds] |
| 100 | a1 | type of pick (a=automatic, m>manual) |
| 101 | a1 | direction of short period first motion (c=compression, d=dilation, -=null) |
| 102 | a1 | onset quality (i=impulsive, e=emergent, q=questionable, -=null) |
| 104-108 | a5 | magnitude type |
| 110-113 | f4.1 | magnitude value |
| 115-125 | a11 | arrival identifier |
| 127-131 | a5 | agency |
| 133-140 | a8 | deployment |
| 142-143 | a2 | location |
| 145-149 | a5 | author |
| 151-155 | a5 | reporter |
| 157-159 | i3 | phase channel |
| 161-163 | i3 | amplitude channel |
| 165 | a1 | direction of long period first motion (c=compression, d=dilation, -=null) |
